To determine the price for the maintenance service we need to measure each pool and price is giving accordingly.

RENOVATIONS

POOL RESURFACING:

There are a few signs that can let you know your pool is in need of a Pool Resurfacing:

- Rough material.
- Plaster peeling or flaking off.
- Heavy Stains.
- Discolor plaster.
- Leaks.

To do a pool resurfacing first we need to prepare the existing surface to assure bonding. At this moment, if the customer has decided to change tiles, we proceed to remove all the existing ones and replacing them with the new option chose by the customer. Once this process is done and the surface is thoroughly prepared accordingly, the new plaster can be applied. After the new plaster is on, the pool needs to be Started Up, this is a very critical process since it is the time when the plaster cures properly.

At this moment it is also a good option to change the tiles of the pool.

ACID WASH:

This is a process that works by removing a thin layer of plaster off the surface of the pool. We recommend this treatment when pools are looking dull, have a few stains that are not able to be removed by brushing or vacuuming, or algae has set for a period of time staining the surface of the pool. By acid washing a pool and removing a thin layer all these stains can be removed leaving your pool with a fresh new look.

Having said that, not all inground concrete/gunite pools can be acid washed and a previous evaluation from our supervisors is always performed before offering this kind of service to our customers.

DECK PAINTING:

Sometimes by doing a few changes in your patio, your backyard can have a different and renew look. One of these changes is the option of Painting your deck. We prepare the surface depending on the material and proceed to apply the new color selected by the customer.

POOL RECOVERY FROM GREEN TO CLEAN

When your pool starts to turn green, it indicates that there is algae presence in your pool water.

Algae is a very small microorganism that grows very rapidly in warm water. This can easily happen during the change of seasons and it can surprise you overnight.

Green pools are very unsafe to swim in it because where algae goes, bacteria follows and if there is not enough chlorine to kill algae, there is definitely not enough chlorine to kill viruses, parasites and bacteria that could make you sick. Having a green pool can also be a breeding ground for many insects.

There are many reasons why a pool can turn green, this are the most comun ones:

- [] Lack of Chlorine
- [] Unbalance Water
- [] Pollen or High load of Organic Material
- [] Fertilizers from mowing your lawn

There are many ways to get rid of algae, it will all depends on how green your pool is. But there is only one outcome after we take action: a clean and healthy pool.

REPAIRS:

Our repair technicians are able to fix or replace any pool equipment that is not working properly. We evaluate each case and give our customer the best advice regarding energy efficiency equipment and best option cost effective.

LEAK DETECTION SERVICE:

Before performing a leak detection service, we test for evaporation.

Once we determine is not due to evaporation, a proper leak detection must be performed. We have many ways to test and identify where the leaks are. Those test includes: the ink test, test by pressuring the lines to determine in which one there is a leak, sound test, visual inspection, etc.

We also look for structural damage, cracks inside and outside of your pool and deck area as well as an in depth inspection of all the components involved in the proper functioning of your pool (jets, main drain, skimmers, tile line, grout, etc)

POOL INSPECTIONS:

You have finally found the house of your dreams with the pool of your dreams. So before closing the deal, it is time to call a team of professionals to inspect one of the most valuable assets in your new home: The Pool.

Pools can have complex equipment and you have to rely on professionals to do the proper inspection. We at Acqua-Tech can surely help you with that.

POOL CONSTRUCTION:

The process starts once you have decided to give your backyard a new look and a swimming pool for you, the family and friends to enjoy.

Our Pool designer will coordinate a meeting to understand your needs, your budget and always considering your backyard size and topography. Based on this meeting a 3D model is created and at this time you can start adding, changing and modifying looks that are easy to view in a 3D model render. The selection of pool equipment is the following step. Once everything is agreed, we start processing the permits and then excavation is the following step. This is when the actual pool construction starts. From this moment up till when the pool is ready, can take about from 6-8 weeks. During this time, phases like rebar, plumbing, electrical, gunite, tile, plaster and finally the startup will give your pool the look you dreamed.

SCREEN ENCLOSURE INSTALLATION AND REPAIR:

Having a Screened Enclosure/Lanai is a great addition to your home and lifestyle. It also brings you lots of benefits:

- * Keep insects, bugs and debris out of the area.
- * Gives a little privacy.
- * Increase the living area of your house
- * Safe outdoor environment for little kids and pets.

From designing it, to building it and re-screening it, we have it all.

PAVER INSTALLATION AND PAVER SEALING:

Paver Sealing is a very important tool to keep patios, decks and driveways clean and looking as the day they were installed. Beside cleanliness it has many benefits, including :

- * Reduce moss growth
 - * Help repel oil, grease and stains
 - * Deters ants and many other insects
 - * Easier to clean
 - * Enhance brightness, texture and color of the Paver
-
- * Resistant against harsh weather conditions and with summer around the corner, this is the perfect time to do it

You can choose from matte, midgloss to a shiny finish.

PRESSURE WASH:

It is one of the preferred methods of cleaning a variety of surfaces in residential and commercial locations. This process consists in a gas engine or electric motor, that forces water at a high pressure through a nozzle to quickly blast away accumulated stains/dirt. This can easily be applied to walking surfaces, decks, sidewalks, patios, screens and driveways

SOFTWASH:

This cleaning solution is Eco-Friendly and it consists in using a combination of surfactants, SH and water to ensure your exterior is clean without the risk of stripping the protective coat of your home's exterior. Soft washing is done using less than 500 PSI for cleaning application. Soft washing is better recommended for soft surfaces like stucco, screens, vinyl sidings, wood panel and roofs.
